Until recently, the study of natural selection in humans has largely been restricted to comparing individual candidate genes to theoretical expectations. Abstract. Human harvest of phenotypically desirable animals from wild populations imposes selection that can reduce the frequencies of those. Natural selection is the differential survival and reproduction of individuals due to differences in .. The polymorphism at the human ABO blood group locus has been explained in this way. Different types of selection act at each life cycle stage of.

Positive natural selection, or the tendency of beneficial traits to increase in prevalence (frequency) in a population, is the driving force behind adaptive evolution. Wallace, Alfred Russel, Human Selection () (). Alfred Russel Wallace Classic Writings. Paper 5. browsr.com
